Investigating the Performance of Singapore Students from Different Socio-Economic Backgrounds in TIMSS/PIRLS 2011

Chew Leng POON, Hui Leng NG, Pik Yen LIM

54th IEA General Assembly Meeting, Lisbon

Oct 2013

Integrity, the Foundation ■ People, our Focus ■ Learning, our Passion ■ Excellence, our Pursuit

Outline

- Motivation
- Methods
- Key Findings
- Limitations
- Conclusion

Why?

MOTIVATION

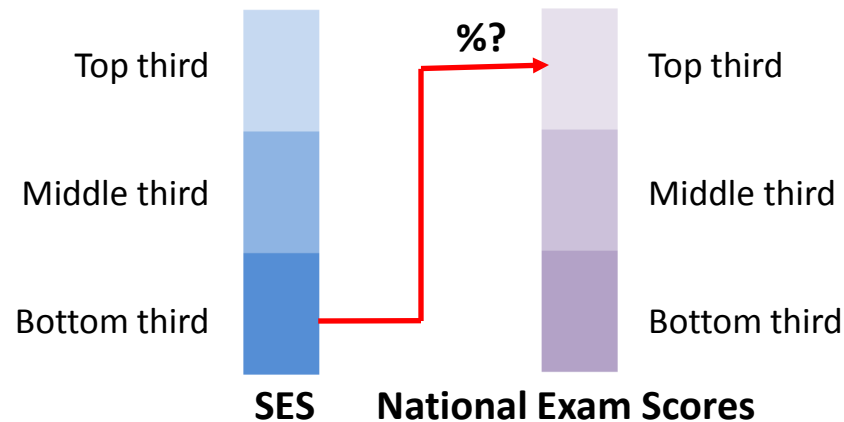

Motivation of Study

- Education as key enabler of social mobility
- Existing debates

Typically framed as zero-sum game, e.g.,

- Ng, I. Y. H. (2012). The political economy of intergenerational mobility in Singapore. *International Journal of Social Welfare*.
- Proportion of students at bottom-third SES in top third of national exams

Motivation of Study

- Ignored reality
 - In 21st century, increasingly borderless world
 - Physical presence no longer pre-requisite in competition for jobs, status, “a good life”

Motivation of Study

- International studies allow 2 types of analyses

Type 1
Within-System

High-SES *cf* Low-SES

Type 2
Between-System

Singapore students *cf*
students in other systems
with similar SES

- For SGP,
 - Both allow monitoring of system-level impact of edn policy changes, including potential trade-offs
 - Type-2 analyses provide additional info that we did not have from our national exams data

Some things we decided to do

- Association between SES and student performance
- Association between student performance and future income
- Educational mobility
- Levels of social inclusion in schools

Research Questions

RQ1: How does the estimated relationship between SES and student performance in Singapore compare to that in other systems?

RQ2: How do students from different SES groups in Singapore perform relative to their peers in other systems from similar SES groups?

How?

METHODS

Methods

- Data:
 - G4 TIMSS & PIRLS (reading, math, science)
 - G8 TIMSS (math, science)
 - Two new scales in TIMSS & PIRLS 2011:
 - *Home Resources for Learning (HRL)*: G4
 - *Home Educational Resources (HER)*: G8
- Proxies for SES

Methods

RQ1: Type-1 Analyses (Within grade/subject)

- Separately for each system S , fitted

$$(1) SCORE_{iS} = \beta_{0S} + \beta_{1S}SES_{iS} + e_{iS}$$

*All SE adjusted for sampling design of both students and items

- Compared across systems:
 - β_{1S} – “slope”
 - R^2 – “strength”

Methods

RQ2: Type-2 Analyses (Within grade/subject)

- Ignore students' system membership, fitted

$$(2) \textit{SCORE}_i = \gamma_0 + \gamma_1 \textit{SES}_i + \varepsilon_i$$

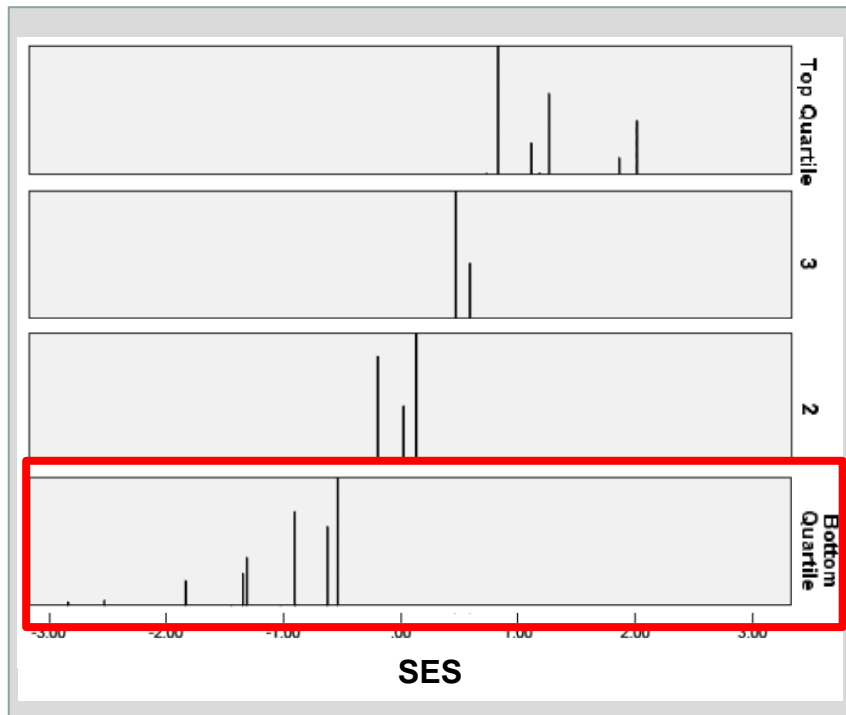

- For each student, computed residual score
- Computed the proportion from each SES quartile within each system in top residual-score quartile internationally

Methods

RQ2: Type-2 Analyses (Within grade/subject)

Within-System SES Quartile

Int'l Residual Score Quartile

What?

RESULTS

Key Findings: RQ1 Type-1 Analyses

Compared to International Average

Table 1. Fitted relationship between achievement scores and SES (HRL/HER) scale scores in Singapore, by grade and subject

Grade /Subject	Mean SES	Mean Score	Slope ($\hat{\beta}_{1s}$)	Strength (R^2) (%)
G4 Reading	0.34* (0.00)	570* (515)	48 (45)	23 (24)
G4 Math	0.36* (0.00)	608* (501)	42 (43)	20 (19)
G4 Science	0.36* (0.00)	586* (501)	52* (47)	24 (21)
G8 Math	0.15* (0.00)	611* (468)	37* (50)	13* (20)
G8 Science	0.15* (0.00)	590* (478)	49 (47)	18 (20)

Notes: International values in parentheses. * denotes cases when Singapore's value is statistically significantly different from the corresponding international value.

Key Findings: RQ1 Type-1 Analyses

Compared to International Average

Table 1. Fitted relationship between achievement scores and SES (HRL/HER) scale scores in Singapore, by grade and subject

Grade /Subject	Mean SES	Mean Score	Slope ($\hat{\beta}_{1s}$)	Strength (R^2) (%)
G4 Reading	0.34* (0.00)	570* (515)	48 (45)	23 (24)
G4 Math	0.36* (0.00)	608* (501)	42 (43)	20 (19)
G4 Science	0.36* (0.00)	586* (501)	52* (47)	24 (21)
G8 Math	0.15* (0.00)	611* (468)	37* (50)	13* (20)
G8 Science	0.15* (0.00)	590* (478)	49 (47)	18 (20)

Notes: International values in parentheses. * denotes cases when Singapore's value is statistically significantly different from the corresponding international value.

Key Findings: RQ1 Type-1 Analyses

Compared to International Average

Table 1. Fitted relationship between achievement scores and SES (HRL/HER) scale scores in Singapore, by grade and subject

Grade /Subject	Mean SES	Mean Score	Slope ($\hat{\beta}_{1s}$)	Strength (R^2) (%)
G4 Reading	0.34* (0.00)	570* (515)	48 (45)	23 (24)
G4 Math	0.36* (0.00)	608* (501)	42 (43)	20 (19)
G4 Science	0.36* (0.00)	586* (501)	52* (47)	24 (21)
G8 Math	0.15* (0.00)	611* (468)	37* (50)	13* (20)
G8 Science	0.15* (0.00)	590* (478)	49 (47)	18 (20)

Notes: International values in parentheses. * denotes cases when Singapore's value is statistically significantly different from the corresponding international value.

Key Findings: RQ1 Type-1 Analyses

Compared to Selected Systems

- Some systems that performed above the international level across all SES groups, but had smaller SES slopes than Singapore:
 - Russian Federation (G4 reading)
 - Chinese Taipei (G4 math)
 - Hong Kong (G4 and G8 math)
 - Korea (G8 science)

Key Findings: RQ1 Type-1 Analyses

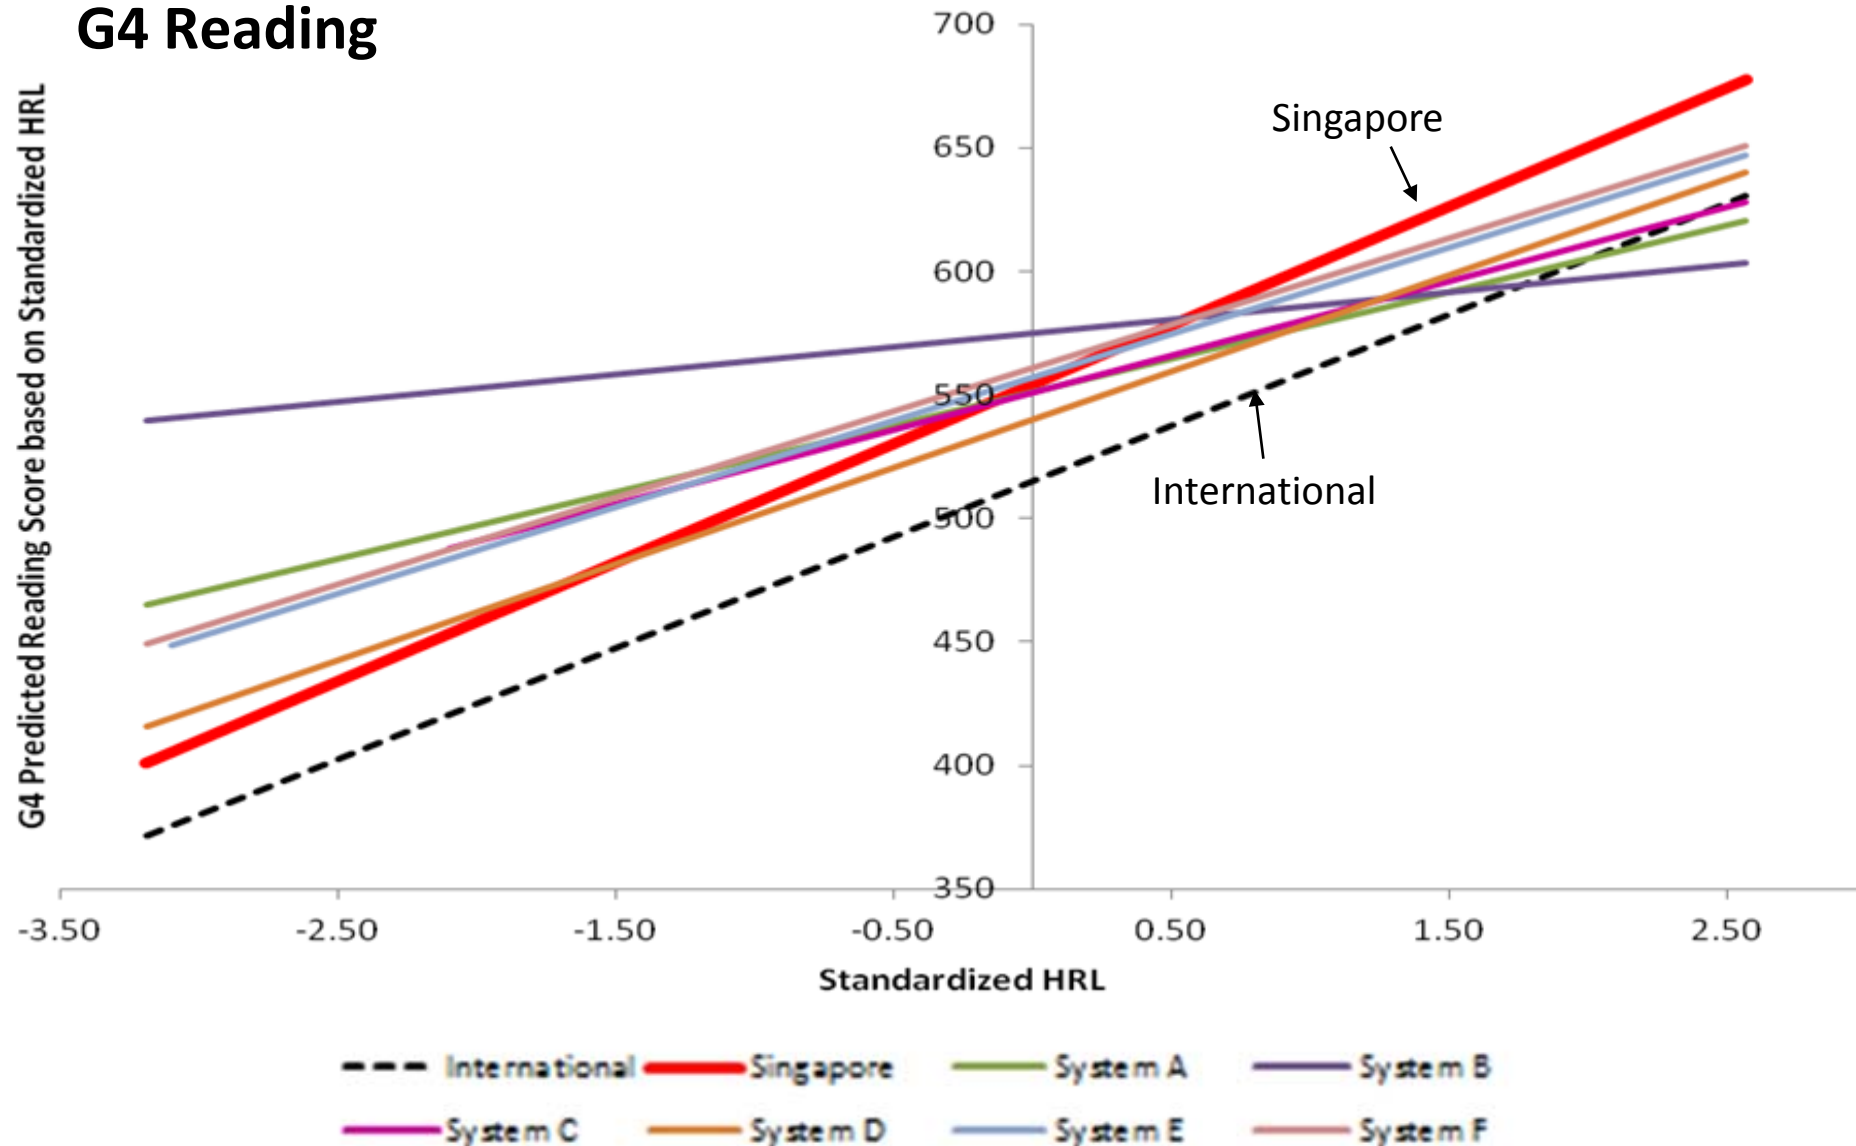

Compared to Other Systems

- Singapore has:
 - Similar regression slopes and strength of association between SES and achievement *cf* the international regression line, except for G4 science & G8 Math
 - Steeper regression slopes than selected comparison systems, except for G8 Math
- But, need to view in relation to level of performance

Key Findings: RQ1 Type-1 Analyses

Key Findings: RQ2 Type-2 Analyses

Students in Bottom SES Quartile

- High proportion in top residual-score quartile

Table 2. Proportion of students in the bottom and top SES quartiles who were in the top quartile in terms of residual score, by grade and subject

Grade /Subject	% of Students in Top Residual-Score Quartile	
	Bottom SES Quartile	Top SES Quartile
G4 Reading	41* (30)	43* (18)
G4 Math	67* (28)	70* (21)
G4 Science	51* (30)	57* (18)
G8 Math	81* (28)	79* (21)
G8 Science	64* (28)	74* (20)

Notes: International values in parentheses. * denotes cases when Singapore's value is statistically significantly different from the corresponding international value.

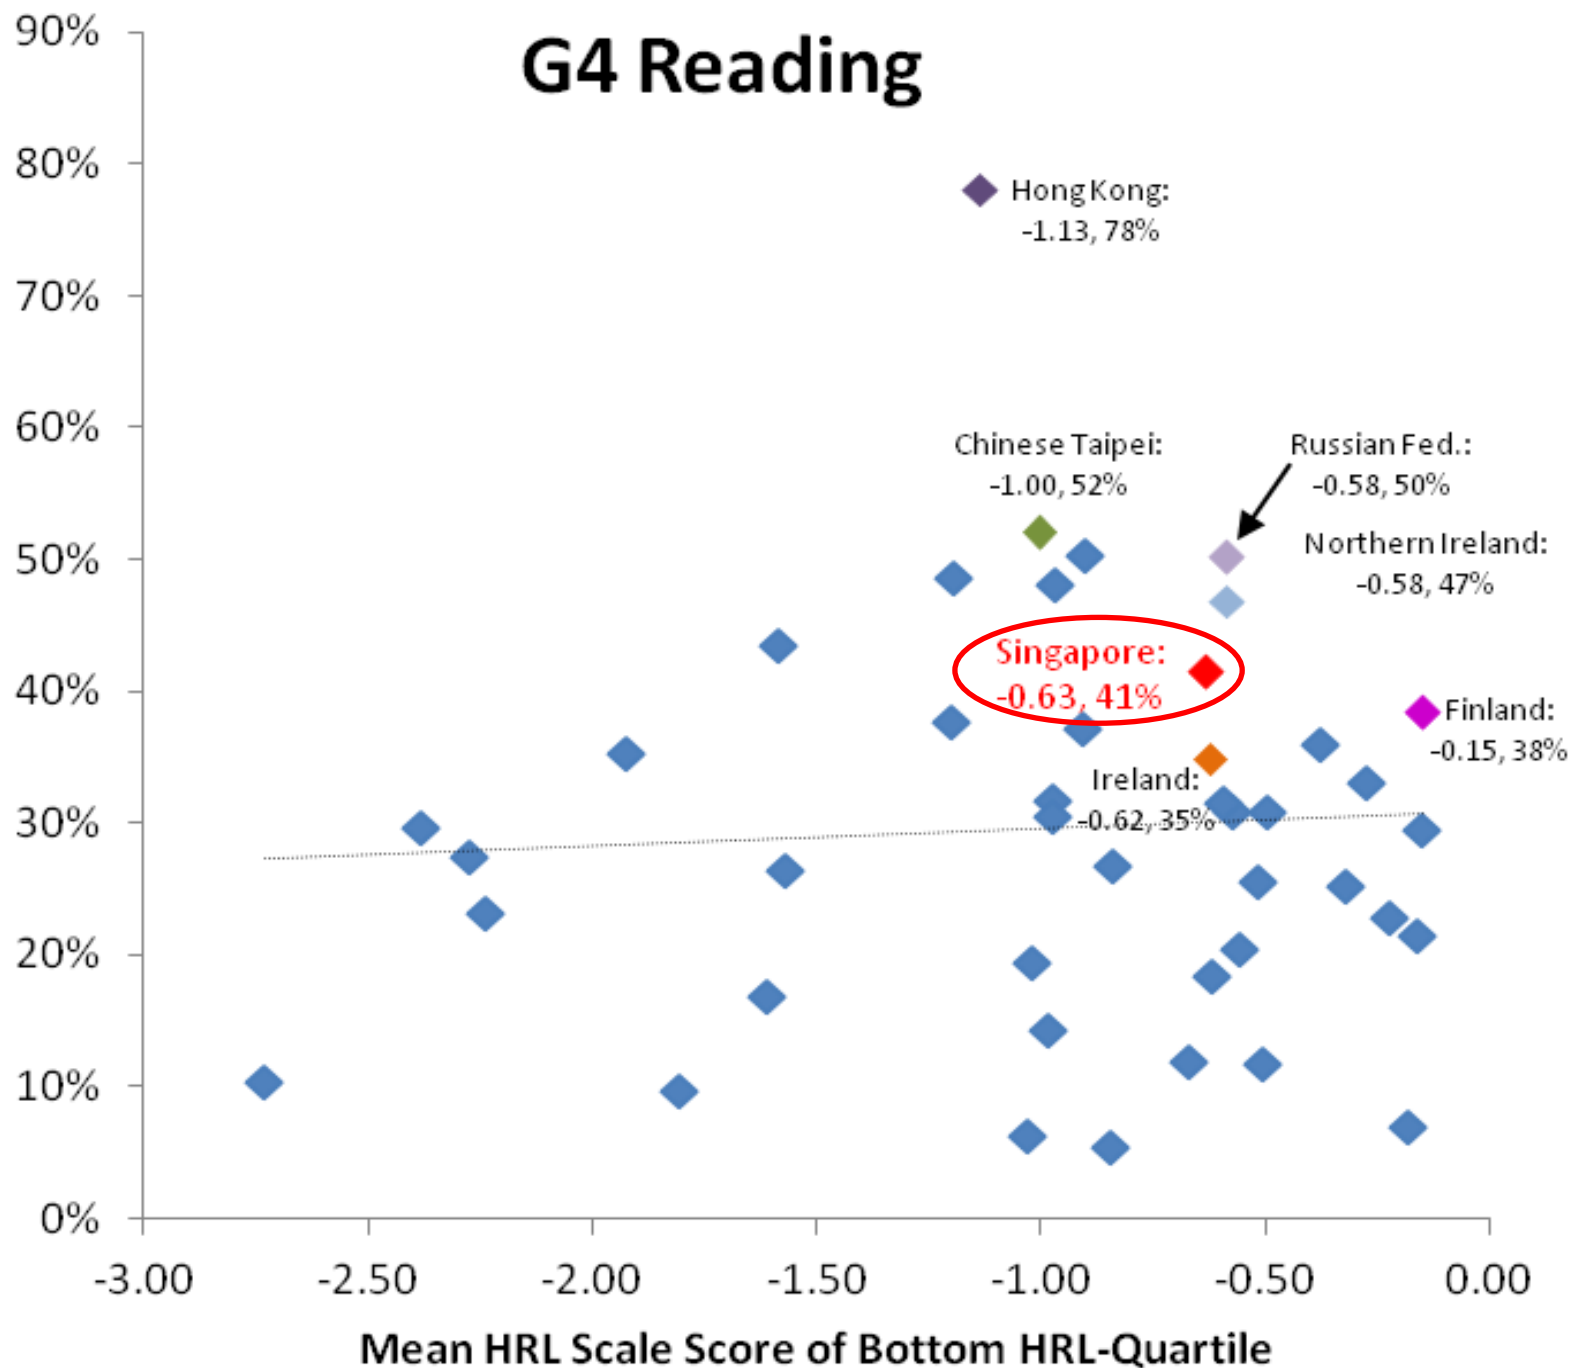

G8 Mathematics

Singapore:
-0.90, 81%

G4 Reading

Proportion of Students in Bottom HRL-Quartile in the Top Residual-Score Quartile

Key Findings: RQ2 Type-2 Analyses

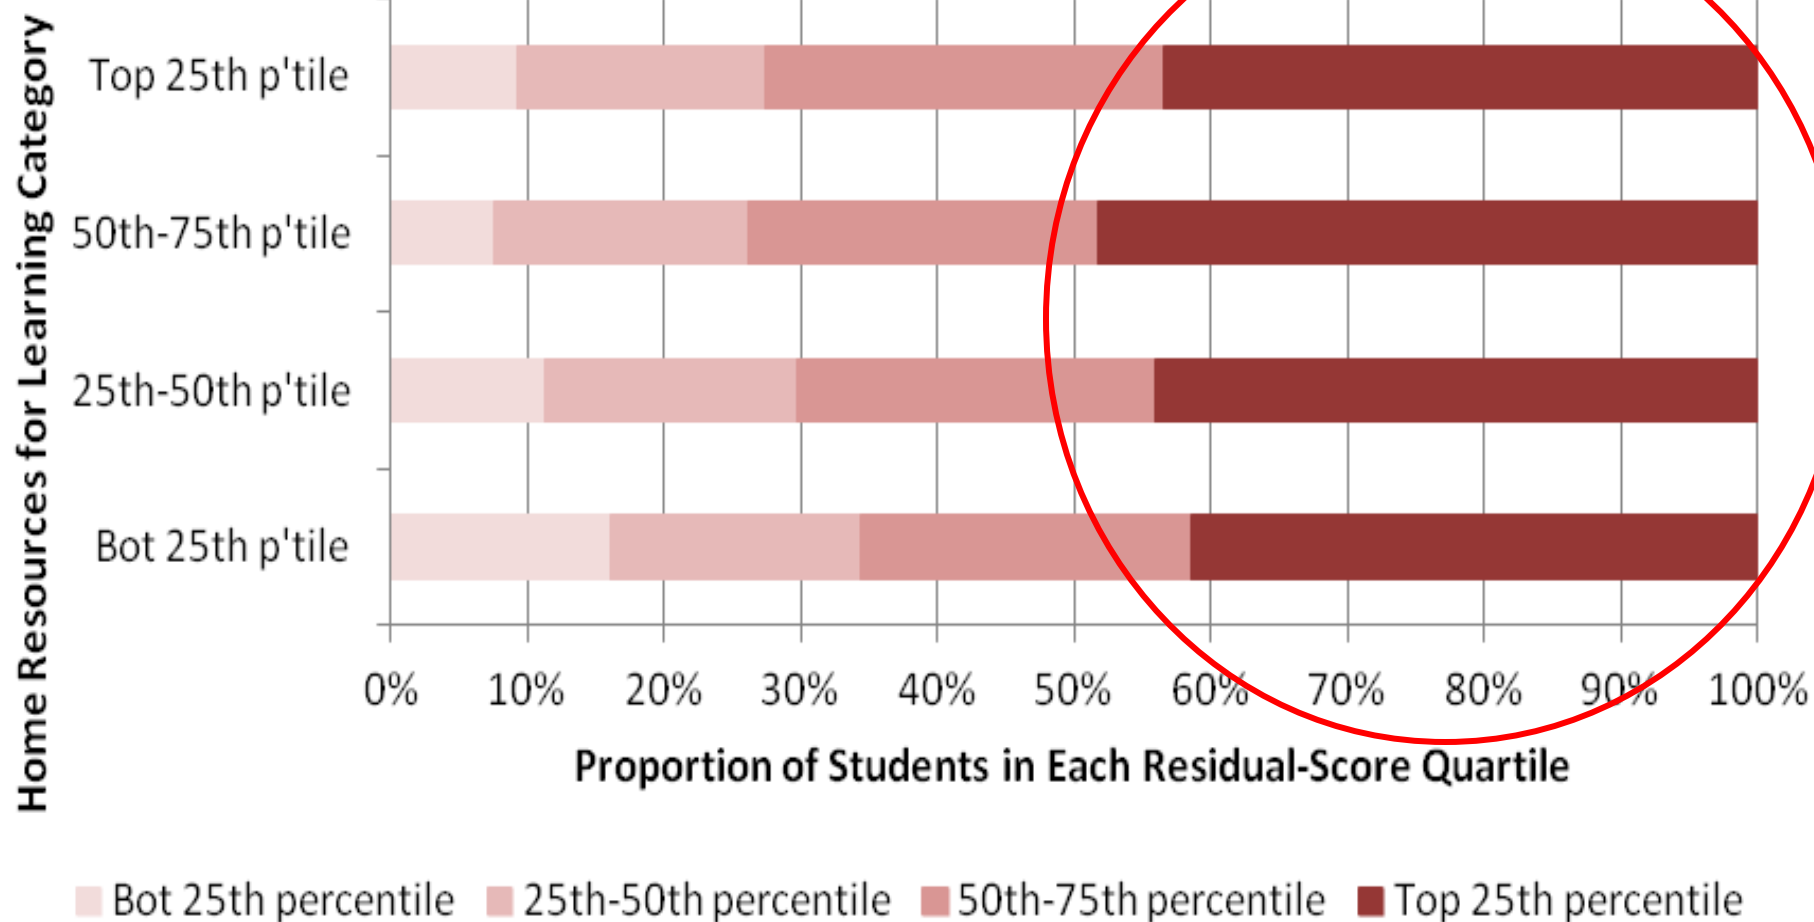

Students in Other SES Quartile

- Also have high proportions from each of the other three SES quartiles in the top residual-score quartile

Key Findings: RQ2 Type-2 Analyses

LIMITATIONS

Limitations

- Residual-type models: Findings not indicative of quality of system in mitigating SES impact
- Instead, reflects collective “effect” of everything not included in model
 - E.g., students’ innate ability, attitudes, home language, ..., together with system factors
- Valid inferences on relative quality of systems require homogeneity in impact of the non-system factors across the systems

CONCLUSION

Conclusion

- Policies to better support lower-performing, lower-SES students, e.g.,
 - MOE Financial Assistance Scheme & Opportunity Fund
 - Learning Support Programmes
 - Strengthen pre-school provisions, e.g., literacy assistance to children from low-income, non-English-speaking homes
 - School-based Student Care Centers

Conclusion

- Analyses like those presented help monitor system-level impact of policy changes
 - Esp. any trade-offs in terms of re-distribution of achievement among SES groups
 - Just as society has to come to consensus about “acceptable” levels of income re-distribution, same thing for achievement re-distribution

Conclusion

“Keeping paths upwards wide open to all in education...has been a fundamental principle for Singapore for a very long time. It is how we have enhanced our human potential. How we have created hope for every Singaporean and is especially true in education”

Singapore PM Lee Hsieng Loong
